Strategies for evaluating and improving the manufacturing process of manufactured goods are known. Manufacturing process evaluation and improvement is accomplished by collecting and analyzing product data. In process improvement, it is recognized that, while process data are necessary, process data alone do not provide sufficient information to make process improvements. More recently, statistical process control techniques have been applied to the analysis of data collected during the manufacture of manufactured goods. The use of statistical process control techniques is commonly referred to as statistical process control (SPC). SPC can be used to evaluate manufacturing processes and make improvements based on the analysis of collected product data. The evaluation of a manufactured good is commonly referred to as process capability assessment. SPC can be used to evaluate the process capability of a manufactured good. A good is a product or service that is manufactured to a certain specification, according to a specific plan. The process of manufacturing a good from raw material to finished product is a complex series of steps that results in a good of a particular quality. A manufacturing process is generally comprised of a number of departments each working independently in the process of manufacturing the good. To create a good, the raw material is supplied to a number of manufacturing departments (e.g., molding, welding, assembly, packaging, quality assurance, finishing, packaging, 2d92ce491b
