-For moist air and air with moisture, which means the liquid particle mass in the air is less than 1 kg per cubic meter of air, the International Civil Aviation Organization (ICAO) proposes a description of air humidity as follows: Humidity ratio humidity ratio is defined as the amount of moisture content divided by dry air mass. Dry air mass: total mass of the air with moisture. Liquid mass: total mass of the liquid (such as water) in the air. The fluidity ratio ratio (FR) is defined as the mass ratio of water to dry air, and usually has a value of between 0.1 and 1.0. RH (rainfall) is the ratio of liquid water to dry air. When liquid water is in a liquid state, the ratio of liquid water to dry air is 0.01; when liquid water is in a gaseous state, the ratio of liquid water to dry air is 0.9999. When liquid water is in a gaseous state, the ratio of liquid water to dry air is 0.01; when liquid water is in a liquid state, the ratio of liquid water to dry air is 0.9999. Consideration of air humidity Considering the humidity ratio is humidity 1d6a3396d6

Airtight System Design and Air Distribution System were designed and built according to the requirements of the project. Design team made regular feedback to ensure the best accuracy. Optimum Performance by maximized the availability of supply air at low cost. It allows to perform the project as specified. The dimensions of duct system was designed to produce the largest possible flow of supply air. The surface area of supply air was divided to the ratio of volume of supply air and exhaust air in order to reduce the proportion of supply air in exhaust air. In this case, the ratio of volume of supply air and exhaust air is 3:1. The distance from supply air inlet to exhaust air outlet is designed to be as short as possible. The efficiency of dampers were calculated to be high. The positions of dampers were optimized to reduce the pressure losses in the duct system. Package Contents 1.
