While AutoCAD has been around for more than 25 years, the legacy version of AutoCAD does not use any Open Source software, nor does it follow any open standards. AutoCAD was and still is the most popular CAD software, and it is still widely used today, being used by millions of users worldwide, and estimated to generate revenue of over \$1 billion annually. Who uses AutoCAD? Some estimates indicate that a majority of architects and engineers, as well as small businesses use AutoCAD. In 2014, Autodesk reported that AutoCAD is the #1 most popular software used by CAD operators worldwide, with about 30 million licenses sold. This makes AutoCAD the most widely used desktop CAD software. However, according to market research conducted in 2014, the worldwide mobile market is the fastest growing market in the industry, while desktop market growth is in a decline. Consequently, mobile users outnumber desktop users. Companies who use AutoCAD, according to the above research, include the following: J.P. These companies, and many others, use AutoCAD for a variety of purposes, including architectural design, construction, and asset management, among many others. To evaluate the efficacy and tolerability of exercise therapy compared with once-daily dosing of low-dose pioglitazone (30 mg/day) for patients with type 2 diabetes. In this 12-week randomized, open-label, controlled study, 149 outpatients with type 2 diabetes were randomly assigned to exercise therapy or treatment with low-dose pioglitazone. The exercise therapy group performed aerobic and resistance exercises 3 times per week. The primary outcome measure was the change in glycated hemoglobin (HbA1c) at 12 weeks compared with baseline. The mean (SD) HbA1c level was 7.3 (1.0)% before the exercise intervention and 7.1 (0.9)% after the exercise intervention. The mean HbA1c level was 7.4 (0.8)% at week 12 and did not differ significantly between the groups. Of the 149 patients, three withdrew (two in the exercise therapy group and one in the pioglitazone group) due to adverse events and seven patients (five in the exercise therapy group and two in the pioglitazone group) did not complete the study. In the exercise therapy group, five patients withdrew due to adverse events, three patients developed severe hypoglycemia, one had edema, and one
