

---

After seeing the correct answer I can see that you will need to use the absolute path of the image. In your case it would be: `icon = QtGui.QIcon("images/icons/write.png")` A: `icon = QtGui.QIcon(QCoreApplication.applicationDirPath() + "/images/icons/write.png")` There has been known an electric rotary machine that has a torque generator for generating a predetermined magnitude of torque and a conversion element for converting rotational energy of an output shaft of the torque generator into electric energy for supplying the torque generator and the electric rotary machine with the electric energy (see, for example, Patent Literature 1). The electric rotary machine disclosed in Patent Literature 1 has: a drive shaft; a rotor that is fixed to the drive shaft and rotates together with the drive shaft; an armature winding that is formed by connecting a plurality of phase coils to each other to be wound in a winding window provided in the rotor in a circumferential direction thereof; and a stator that is disposed radially outwardly of the armature winding and has a plurality of stator core teeth. A plurality of stator teeth are formed in such a manner as
